

FMW's advanced technologies and wide experience in the processing of non-wood fibres guarantee the highest yield and quality of fibres.

Processing of bagasse, straw, reed, bamboo, jute and kenaf

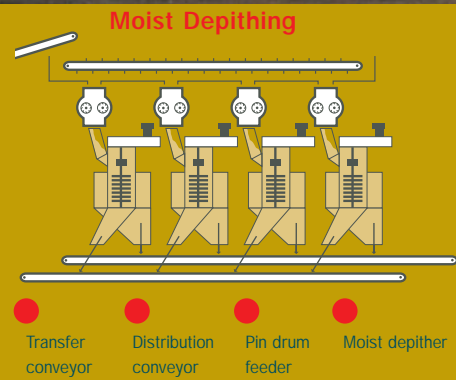

- Modular designs offer solutions for any customer's requirements
- Capacities of Moist Depithing, Wet Storage and Wet Cleaning according to mill production:

Moist Depithing up to 1.500 bdt/d each processline*

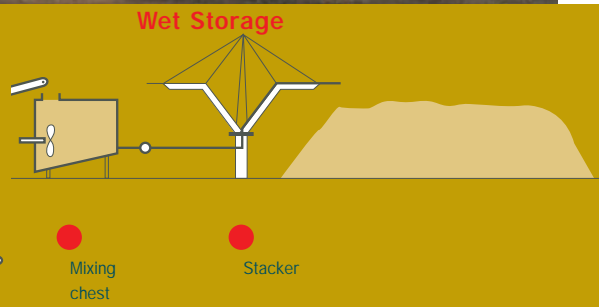

Wet Storage up to 200.000 bdt/d each processline*

Wet Cleaning up to 400 bdt/d each processline*

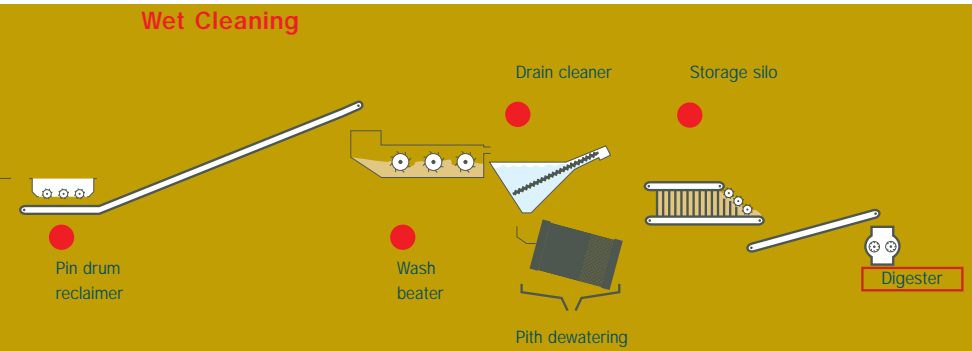

*multi line arrangements possible

Moist depithing (fibre/pith separation) includes bagasse receiving and handling systems for fibre and pith

This system provides a continuous supply of excellent fibre quality during off-season.

Wet cleaning is a highly efficient process for removal of pith, sand, and fines and includes pith dewatering. Digester feed system provides a constant and uniform material flow to the fiberline

The Bioliquor System is an essential part of the FMW-Bagasse-Technology for long time bagasse storage.
